Exam : **AZ-102**

Title : Microsoft Azure
Administrator Certification
Transition

Version : DEMO

1. You have an Azure Active Directory (Azure AD) tenant named contosocloud.onmicrosoft.com. Your company has a public DNS zone for contoso.com.

You add contoso.com as a custom domain name to Azure AD. You need to ensure that Azure can verify the domain name.

Which type of DNS record should you create?

- A. PTR
- B. MX
- C. NSEC3
- D. RRSIG

Answer: B

2. You have several Windows Server and Ubuntu Linux virtual machines (VMs) distributed across the two following virtual networks (VNETs):

- prod-vnet-west (West US region)
- prod-vnet-east (East US region)

You need to allow VMs in either VNET to connect and to share resources by using only the Azure backbone network.

Your solution must minimize cost, complexity, and deployment time.

What should you do?

- A. Add a service endpoint to each VNET.
- B. Configure peering between prod-vnet-west and prod-vnet-west.
- C. Create a private zone in Azure DNS.
- D. Deploy a VNET-to-VNET virtual private network (VPN).

Answer: B

3. Our company's local environment consists of a single Active Directory Domain Services (AD DS) domain.

You plan to offer your users single sign-on (SSO) access to Azure-hosted software-as-a-service (SaaS) applications that use Azure Active Directory (Azure AD) authentication.

The tenant's current domain name is companycom.onmicrosoft.com.

You need to configure Azure AD to use company.com as the organization's owned public domain name.

What should you do?

- A. Add company.com as a user principal name (UPN) suffix to the AD DS domain.
- B. Run Azure AD Connect from a domain member server and specify the custom installation option.
- C. Remove the companycom.onmicrosoft.com domain name from the Azure AD tenant.
- D. Add a DNS verification record at the domain registrar.

Answer: D

4. Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some questions sets might have more than one correct solution, while others might not have a correct solution. Determine whether the solution meets the stated goals.

Your company registers a domain name of contoso.com.

You create an Azure DNS Zone named contoso.com and then you add an A record to the zone for a host

named www that has an IP address of 131.107.1.10.

You discover that Internet hosts are unable to resolve www.contoso.com to the 131.107.1.10 IP address. You need to resolve the name resolution issue.

Solution: You modify the name server at the domain registrar.

Does this meet the goal?

A. Yes

B. No

Answer: A

5.Note: This question is part of a series of questions that present the same scenario. Each questions in the series contains a unique solution that might meet the stated goals. Some questions sets might have more than one correct solution, while others might not have a correct solution. Determine whether the solution meets the stated goals.

Your company registers a domain name of contoso.com.

You create an Azure DNS Zone named contoso.com and then you add an A record to the zone for a host named www that has an IP address of 131.107.1.10.

You discover that Internet hosts are unable to resolve www.contoso.com to the 131.107.1.10 IP address. You need to resolve the name resolution issue.

Solution: You add an NS record to the contoso.com zone.

Does this meet the goal?

A. Yes

B. No

Answer: B
